SUMMARY

System architect at heart, with a knowledge domain spanning from chip design in SystemVerilog through OS internals and networking to full-stack web development. Capitalising on a deep interest in the Linux kernel, I harness eBPF as a first-class tool for performance optimisation and security — rounding up into DevOps, a discipline demanding a specialised generalist who treasures the plan more than the speed.

EDUCATION

B.S. in Computer Engineering · King Saud University

Jul 2023 – Jul 2028 (expected)

EXPERIENCE

Site Reliability Engineer · Entropy AI · Riyadh, SA

Nov 2025 – Present

Full-time · Axiom product

- Diagnosed a silent TLS handshake failure cascading across the Axiom ML platform; took full ownership of the backend: Metaflow for training pod orchestration, Temporal for workflow durability, and MLflow for per-job experiment tracking.
- Architected a custom embedded analytics solution for Axiom, eliminating enterprise licensing costs via an Nginx reverse-proxy sidecar for header manipulation and session pre-seeding.
- Led the architectural transition of Yameen — an AI agent that joins live online meetings — from a per-user monolith to a macroservice architecture via the strangler fig pattern: coupled services that cannot operate independently, scaled those that can. Delivered full IaC with strict secrets management, tightening isolation and security posture.

TECHNICAL SKILLS

Languages	Python, Rust, Go, Java, SystemVerilog, eBPF
Cloud & Infra	AWS, GCP, Kubernetes, Docker, Terraform, Temporal, GitHub Actions, ArgoCD, Linux
LGTM Stack	Loki, Grafana, Tempo, Mimir · OpenTelemetry

ACHIEVEMENTS

1st Place – AWS GameDay (Networking & Security) · Team Lead

May 2025

- Led under a divide-and-conquer strategy; solely owned networking and security: deployed an ALB, mitigated an HTTP flood via a custom WAF rule, redirected VPC Flow Logs to S3. Achieved #1 in networking, #4 overall.

PROJECTS

SPiCa – eBPF Rootkit Detection Engine · Rust, eBPF (Aya), Tokio · *105 · 72eCHO Newsletter · LinuxSecurity.com

2026

- Detects kernel-level threats — DKOM, scheduler manipulation, NMI suppression — invisible to commercial EDRs including Elastic Security and CrowdStrike Falcon. Validated against nysm, singularity, diamorphine, and reptile.

github.com/0xKirisame/spica · kirisame.dev/blog/SPiCa

Shinkai Shoujo – Open-Source CIEM · Rust

2026

- Agentless, free alternative to Wiz (\$100k+/yr). Correlates OTel traces with AWS IAM policies to surface unused permissions and auto-generates Terraform for least-privilege enforcement. Zero deployment required.

github.com/0xKirisame/Shinkai-Shoujo

VOLUNTEERING & AFFILIATIONS

Tuwaiq Club at KSU · Technical Leader

2025 – Present

- Pioneered the first open-source club management system at KSU: KPI tracking, attendee performance dashboards, automatic volunteering-hours calculation, and member analytics.

github.com/Tuwaiq-Club-KSU

Future Technology Club · Public Relations

Jan 2025 – Sep 2025

- Built *Flandre Was Hungry* — Python OSINT tool harvesting café/bakery data from OpenStreetMap within 50 km of KSU, identifying 300+ leads and enriching sponsor profiles.

github.com/0xKirisame/Flandre_was_hungry

GameBox Hackathon · Technical & Operations Team

Nov 2025

- Uncovered missing security headers and 3 exposed metadata endpoints; replaced physical booths with WASM-compiled games via S3+CloudFront within free-tier limits.
