Summary

SRE and backend engineer specialising in systems design, distributed infrastructure, and observability. Focused on building production-grade systems end-to-end — from low-level kernel tooling and eBPF-based security research to cloud architecture, ML platform engineering, and backend services.

Education

B.S. in Computer Engineering · King Saud University

Jul 2023 – Jul 2028 (expected)

GPA: 4.56 / 5.0

Experience

Site Reliability Engineer · Entropy AI · Riyadh, SA

Nov 2025 – Present

- Inherited a silent MinIO connection failure causing cascading ML platform hangs. Diagnosed a TLS handshake failure silently blocking MinIO under load; fix cascaded across multiple downstream issues. Took full ownership of ML backend: Metaflow spawning training pods, Temporal ensuring workflow durability, MLflow tracking experiments per job pod.
- Took full ownership of the observability stack: instrumented with OpenTelemetry, deployed Prometheus, Grafana, Loki, Tempo, and Pyroscope; implemented exemplars linking traces to metrics, built node graphs, and defined SLIs across the platform.
- Architected a custom embedded analytics solution eliminating enterprise licensing costs; engineered an Nginx reverse-proxy sidecar for header manipulation and a Node.js middleware for session pre-seeding.

Technical Skills

Languages	Python, Rust, Go, C++, Bash, Java, eBPF, Verilog
Cloud & Infra	AWS, GCP, Kubernetes, Docker, Terraform, Temporal
Observability	OpenTelemetry, Prometheus, Grafana, Loki, Tempo, Pyroscope
Systems	Linux (Arch), KVM, eBPF/XDP, BTF/CO-RE, Aya, Tokio

Achievements

1st Place – AWS GameDay (Networking & Security) · Team Lead

May 2025

- Led team under a divide-and-conquer strategy; solely owned all networking and security tasks: deployed an ALB, mitigated an HTTP flood via a custom WAF rule, redirected VPC Flow Logs to S3 to cut costs. Achieved #1 in networking, #4 overall.

Projects

SPiCa – eBPF Rootkit Detection Engine | Rust, eBPF (Aya), Tokio · ★ 72eCHO Newsletter · LinuxSecurity.com · 2026

- Architected a **binary star** dual-channel detection engine: a BTF tracepoint on `sched_switch` reads `task_struct` directly via CO-RE (`bpf_probe_read_kernel`), bypassing hookable helpers; a second channel fires via **hardware NMI** (CPU cycle counter PMU) — Non-Maskable Interrupts cannot be suppressed in software, making this channel immune to the hooking attacks that defeat commercial EDR including Elastic Security and CrowdStrike Falcon.
- Engineered a **runtime PID obfuscation layer**: a 64-bit key from `/dev/urandom` is written to a `CONFIG` BPF map at startup; both eBPF programs XOR `pid/tgid` before any ring buffer write, defeating rootkits (e.g. Singularity) that filter `bpf_ringbuf_submit` output by PID bitmap. Key rotates hourly, bounding the known-plaintext recovery window. github.com/0xKirisame/spica
- Tokio-based differential FSM cross-correlates `sched` + NMI ring buffers against `/proc`: `[DKOM]` fires when a kernel-scheduled TGID is absent from `/proc` for >2 s; `[PROBE_TAMPER]` fires when NMI sees a TGID the `sched` channel has never observed — confirmed against `nysm`, `singularity`, `diamorphine`, and `reptile`. kirisame.dev/blog/SPiCa

Shinkai Shoujo – Open-Source CIEM | Rust

2026

- Free, open-source Cloud Infrastructure Entitlements Management (CIEM) — agentless alternative to solutions like Wiz (\$100k+/yr). Correlates OTel traces with AWS IAM policies to surface unused permissions and auto-generates Terraform to enforce least-privilege access. Zero deployment required. github.com/0xKirisame/Shinkai-Shoujo

Volunteering

Tuwaiq Club at KSU · Technical Leader

2025 – Present

- Built a zero-config email automation system that parses a CSV to generate and dispatch personalised emails per training track with custom themes — no manual configuration required. github.com/Tuwaiq-Club-KSU/Tuwaiq-Club-Auto-Mailer

AWS Club at KSU · VP of Technology

2025 – Present

Future Technology Club · Public Relations

Jan 2025 – Sep 2025

- Built *Flandre Was Hungry* — a Python OSINT tool harvesting café/bakery data from OpenStreetMap within 50 km of KSU, auto-generating Excel reports and identifying 300+ leads; leveraged OSINT to enrich sponsor profiles with minimal public data. github.com/0xKirisame/Flandre_was_hungry

GameBox Hackathon · Technical & Operations Team

Nov 2025

- Conducted a pentest uncovering missing security headers and 3 exposed metadata endpoints; replaced physical expo booths with a web-based solution: deployed WASM-compiled games via S3+CloudFront, serving all attendees in-browser within free-tier cost limits. ftcgamebox.com
